- ABE License 150 Concurrent Calls
- ABE License 200 Concurrent Calls
- ABE License 250 Concurrent Calls

Please note that Asterisk Business Edition comes with 10 Concurrent Calls as minimum. If you require more please use the options below.

Easy to Install, Configure and Use Asterisk Business Edition includes a supported rPath™ Linux distribution with an enhanced installer, making Asterisk even easier to install, configure, and use. To enhance customer interactivity with an Asterisk PBX, Asterisk Business Edition is integrated with the LumenVox™ Speech Recognition Engine and Cepstral™ Text-to-Speech. A trial version of the Cepstral product is included, and one free port of Lumenvox Lite is also available upon request to Asterisk Business Edition customers. The purchase of a separate license is necessary to activate additional functionality of these products. Performance, Interoperability and Reliability Digium's comprehensive test program ensures Asterisk Business Edition's reliability, performance, and interoperability with key hardware, software, and protocols. Digium hardware cards are tested for full compatibility with Asterisk Business Edition, as are several select models of servers, VoIP, and TDM devices. All major software features in Asterisk Business Edition are thoroughly tested for functionality and reliability. Test bed systems are also subjected to extreme stress conditions using Empirix™ test equipment to simulate hundreds of thousands of calls in various real-world combinations and configurations. As a result, customers can rely on their combination of proven Asterisk software and Digium hardware to work together to provide a feature-rich PBX or VoIP system. Extreme Cost Reduction Combined with low-cost telephony hardware, Asterisk Business Edition can be used to create a PBX at a fraction of the price of traditional PBX and key systems, while providing a level of functionality exceeding that of many of the most expensive systems available. Control Asterisk Business Edition allows you to take control of your phone system. Once a call is sent to an Asterisk Business Edition embedded system, anything can be done to it. In the same way that Apache gives the user fine-grained control over virtually every aspect of its operation (and its Open Source nature gives even more flexibility), the same applies to Asterisk Business Edition. Rapid Deployment and Development Asterisk Business Edition allows PBX's and IVR applications to be rapidly created and deployed. Its powerful CLI and text configuration files allow both rapid configuration and real-time diagnostics. Rich, Broad Feature Base Because Asterisk Business Edition is implemented in software, not only does it provide features such as voicemail, voice menus, IVR, and conferencing, which are very expensive for proprietary systems,

# Digium Asterisk Business Edition Silver Subscription

but it also allows new features to be added rapidly and with minimal effort. Customization Through its internationalization support, configuration files, and source code, every aspect of Asterisk Business Edition can be tweaked. For example, Asterisk Business Edition's codes for call features could be changed to match an existing system. Dynamic Content Deployment In the same way that web servers like Apache allow a user to deploy dynamic content, such as account information, movie show times, etc, on the web, Asterisk Business Edition permits you to deploy such dynamic content over the telephone, with the same ease as CGI. Extremely Flexible Dialplan Asterisk Business Edition's unusually flexible dialplan allows seamless integration of IVR and PBX functionality. Many of Asterisk Business Edition's existing features (and desired features of the future) can be implemented using nothing more than extension logic. Asterisk Business Edition supports a mix of extension lengths.

**Price: £265.00**
