Xorcom TwinStar TS2000 Failover IP PBX

Product Name: Xorcom TwinStar TS2000 Failover IP PBX

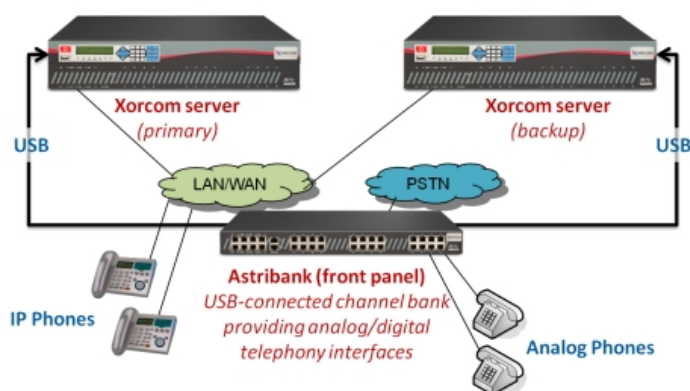

Manufacturer: Xorcom

Model Number: TS2000

Availability: In Stock

Xorcom TwinStar TS2000 Failover IP PBX for XE2000

TwinStar Server Redundancy - TS2000/TS3000 - Award-winning solution providing rapid failover for entire Asterisk-based PBX. The TwinStar configuration (P/N TS2000 or TS3000) is a bundled product, comprised of two module-less servers, based on the Xorcom XE series IP-PBX, that have been optimized for use as a failover system. Sample TwinStar Redundant Server Configuration

TwinStar System Description TwinStar provides full redundancy for a complete PBX system, including telephony interfaces. A sophisticated automatic replication and detection mechanism located in the Astribank detects server failure and switches all telephony to the backup server, keeping downtime to an absolute minimum. The firmware-based switching mechanism is not network-dependent. The servers used in the TwinStar configuration are either the XE2000 or the XE3000. The former meets the requirements of smaller installations, supporting up to 200 users and 45 concurrent calls. The latter is more robust, supporting up to 1000 users and 480 concurrent calls. To complete the configuration, select the relevant Astribank model(s) based on the telephony interface requirement (the number of analog and digital ports and trunks to be supported).
